Friendstant is a mobile application that helps students create life-long friendships and create connections with other students, over a meal. The app chooses whom you meet and the "meet up" is instantaneous from the time you match. We are seeking a Computer Science major who can help with iOS and Android code. Friendstant has already been created for iOS and is about to be submitted to the App Store. We have written the code in Objective C, so you must be fluent in it. We will be offering equity in return for your partnership with us. Friendstant is currently just being run by one student at the University of Arizona and he is a pre-business major who is working to get a degree in Entrepreneurship. To learn more about Friendstant, please visit friendstant.com.

Tasks will include collaborating with the team, writing the code for all updates, creating an Android app based on our success with the iOS app, troubleshooting and more. You will be in charge of all technical aspects, so it will be up to you to decide how to write the Android code. We are counting on your technical knowledge, as the current team has limited knowledge when it comes to the technical side of things. You will be a partner, so you will have a lot of creative freedom.

This is a great opportunity for someone who is truly passionate about Computer Science, as well as for Computer Science majors who wish to build their own business from the ground up.
